Remove technical hurdles and roadblocks to get useful technology into the hands of forest users

Create a thinning pre-assessment tool to plan and assist operators and prototype a Real-time or Near Real-time in field workflow post thinning assessment of tree stocking (and related key metrics)

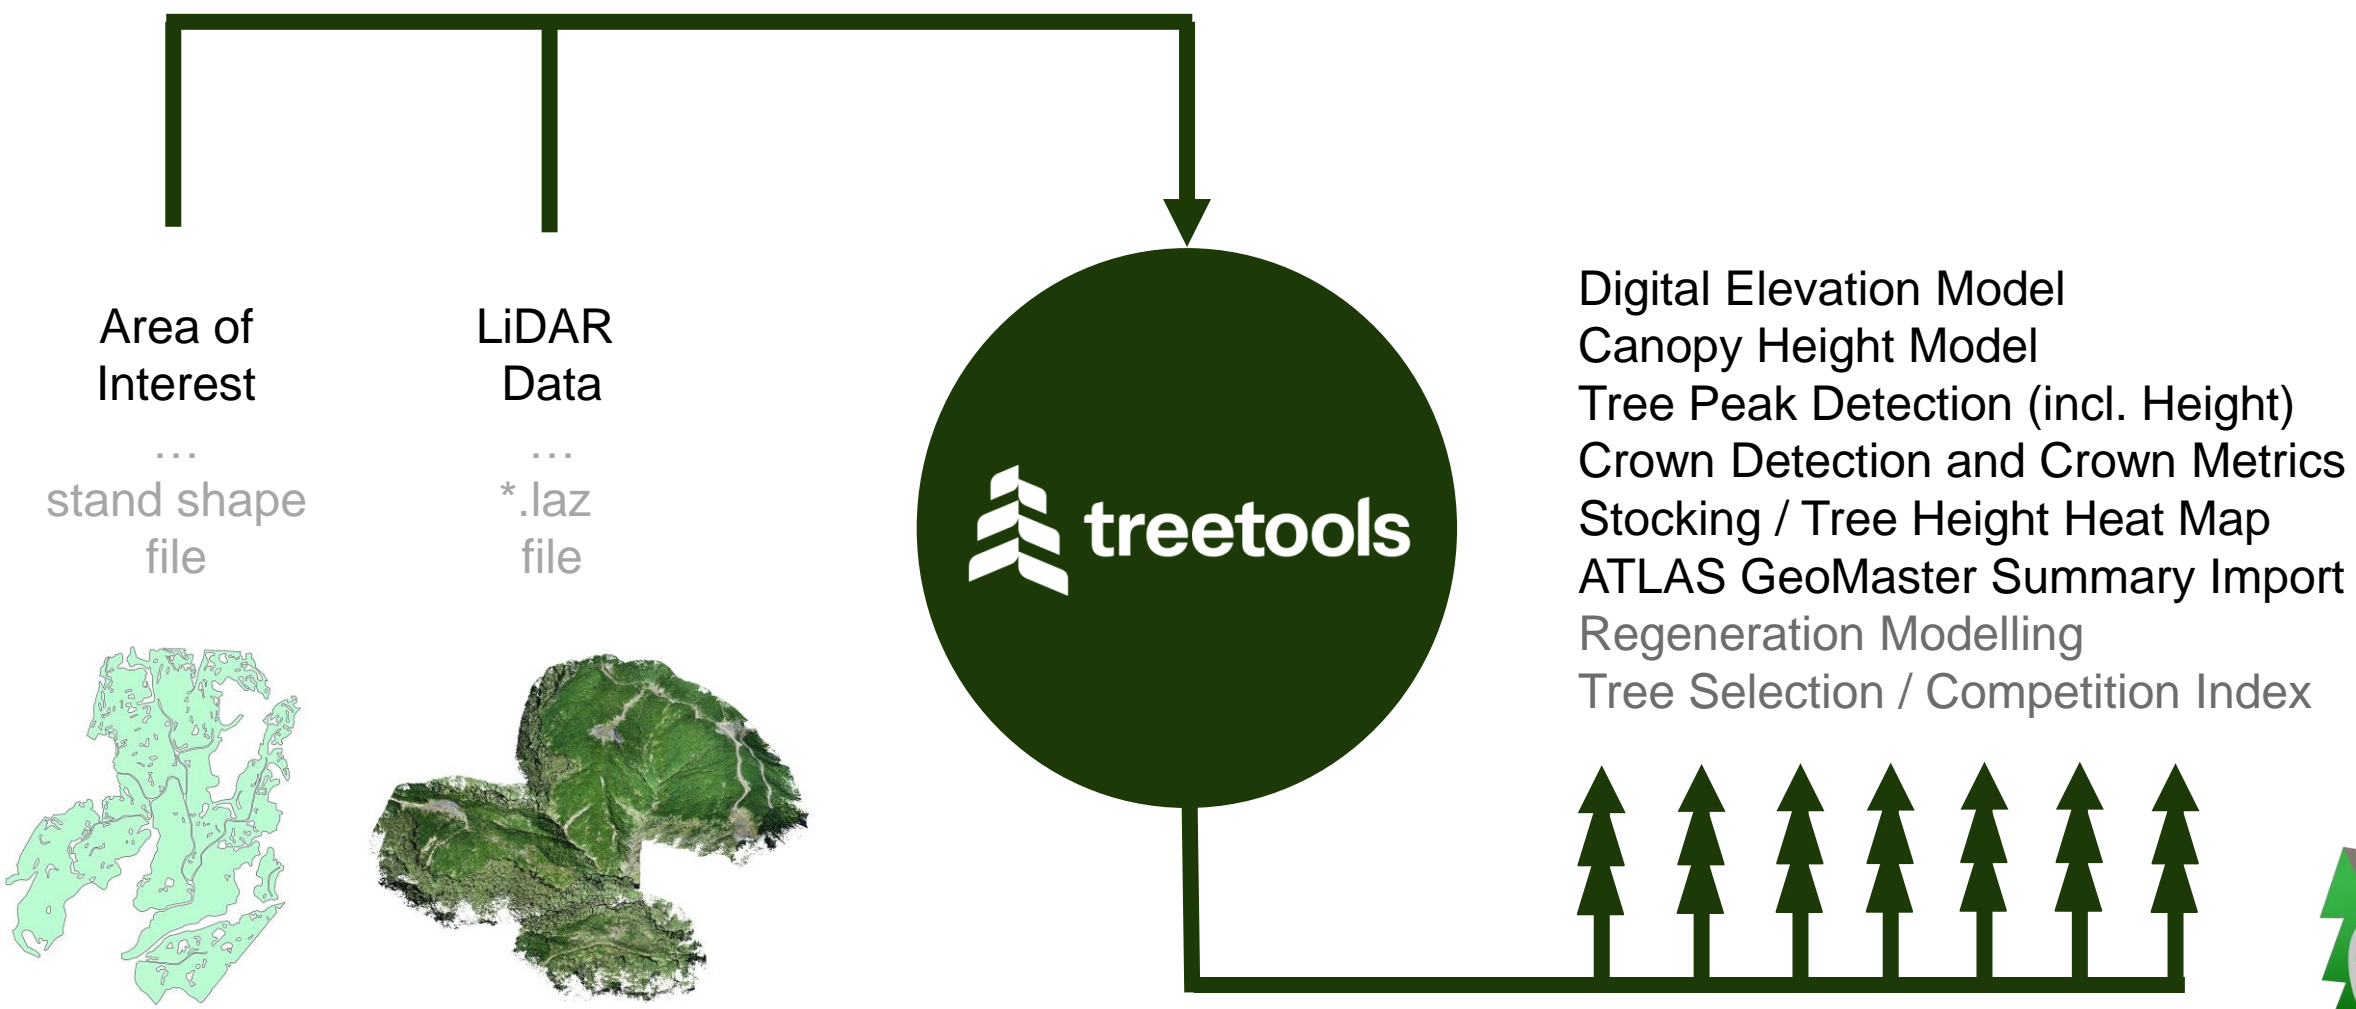

- Stage 1 – pre-assessment workflow for stocking and height
- Stage 2 – post-assessment infield laptop near real-time prototype
- Focused Metrics
 - Pre-assessment
 - Tree Size > Height and Crown Area (with imputed DBH and Volume)
 - LiDAR sensor approach
 - Post-assessment
 - Tree Stocking > Gap Analysis

The future of tree thinning assessment.

Treetools offers pre and post thinning assessments to support forestry decision making.

Now available in BETA format, Treetools has been designed to support forest managers better direct thinning crews and will advance into a real time, in forest, application in future versions.

The first iteration leverages advanced data sources such as LiDAR and RGB imagery to deliver pre and post assessment thinning maps including tree location, stocking, derived gap analysis, digital surface model, tree height and digital crown area.

3D Point Cloud View

A landscape photograph of a sunset. The sun is low on the horizon, partially obscured by the dark silhouettes of a forest of evergreen trees. The sky is filled with scattered clouds, which are illuminated from below by the setting sun, creating a mix of orange, yellow, and blue tones. A semi-transparent dark grey rectangular box is centered in the upper half of the image, containing the text "Where to Next ?" in white, bold, sans-serif font.
